

AUTONOMOUS PROTOCOL SPECIFICATION • TROBIUM BLOCKCHAIN • BY LEXVRA

Equora.Fi

Autonomous peer-to-peer matrix execution, deterministic push settlement, and on-chain protocol allocation.

CUSTODY: Zero (Self-Custodial)

PLATFORM FEE: 0.00% Zero Spread

SETTLEMENT: Push at Block Speed

GOVERNANCE: 100-Seat Genesis Council

OFFICIAL ARCHITECTURAL SPECIFICATION • MASTER EXECUTIVE OVERVIEW

CORE ENGINE: LEXVRA • TROBIUM BLOCKCHAIN • TROBSAFE WALLET

Architectural Blueprint & Table of Contents

Comprehensive structural breakdown of the Equora.Fi protocol and economic design.

01

Systemic Failures

Structural failure modes of custodial treasuries, manual withdrawals, and off-chain ledgers.

02

Protocol Invariants

Six immutable mathematical guarantees: zero custody, zero platform fees, and push settlement.

03

Technology Engine

Trobium Blockchain throughput, live TROB pricing feeds, and frictionless 5-digit registry IDs.

04

Participant Lifecycle

The 10-step deterministic user trajectory from wallet pairing to multi-tier dividend settlement.

05

The 4 Protocol Pools

35% Ecosystem & DAO, 40% Community Salary, 15% Level Rewards, and 10% Magic Blind Box.

06

Matrix Topology

14-node deterministic binary matrix, autonomous auto-upgrade logic, and perpetual liquidity loop.

Autonomous Peer-to-Peer Protocol Architecture

Deterministic mathematical coordination deployed natively on the Trobium blockchain.

Equora.Fi is an autonomous, non-custodial capital distribution protocol deployed on the **Trobium Blockchain**. The system replaces discretionary administrative intermediaries with immutable, mathematically verifiable Solidity smart contracts.

Traditional network platforms pool member capital into custodial corporate treasuries, exposing participants to withdrawal halts, manual gatekeeping, and unilateral rule changes. Equora eliminates counterparty risk entirely through **real-time wallet-to-wallet push settlements** executed at block speed.

Every unit of liquidity entered is distributed peer-to-peer across matrix participants and four automated protocol vaults: **35% Ecosystem & DAO Pool, 40% Community Salary, 15% Level Rewards, and 10% Magic Blind Box**. Net platform retention is mathematically zero.

Mathematical Invariant: 100% Inflow = 100% Outflow • 0.00% Platform Retention

Core Protocol Specifications

- ✓ **Zero Administrative Custody:** Smart contracts execute autonomously without admin keys or withdrawal authority.
- ✓ **0.00% Platform Extraction:** 100% of all capital is distributed to participants and protocol pools.
- ✓ **5-Digit Registry Routing:** Human-readable numeric IDs eliminate complex hexadecimal address error rates.
- ✓ **4 Automated Allocation Pools:** Deterministically funded by Nodes 4, 5, and 14 of completed matrix boards.
- ✓ **Strict 2-Referral Benchmark:** 2 active direct referrals qualify participants for full matrix scaling and pools.

01

Systemic Failure Modes of Custodial Models

Analysis of historical vulnerabilities in centralized custody, discretionary pools, and synthetic tokenomics.

Six Fatal Vulnerabilities of Centralized Platforms

Empirical breakdown of structural design defects that undermine traditional earning networks.

01

Custodial Treasury Risk

Private keys held in operator-controlled wallets create an unavoidable agency dilemma and insolvency risk.

02

Hidden Extraction Fees

Platforms deduct 10% to 30% from deposits and withdrawals to cover management overhead and corporate profit.

03

Discretionary Freezes

Participants must submit manual withdrawal claims, which operators routinely freeze during liquidity stress.

04

Arbitrary Parameter Dilution

Management unilaterally alters compensation tables, increases qualification hurdles, or cancels commissions.

05

Speculative Daily Yields

Unbacked 'daily ROI' models lack economic production, inevitably collapsing when incoming volume decelerates.

06

Single Points of Failure

Centralized servers, SQL databases, and closed-source web hosts can be terminated or censored without recourse.

Historical Failure Benchmarks in Centralized Networks

Documented operational decay across conventional custodial earning platforms.

90%+

18-MONTH FAILURE RATE

Proportion of custodial crypto platforms that halt operations or freeze withdrawals within 18 months.

30%

EXTRACTION SPREAD

Average percentage of retail capital captured by administrative fees, transfer spreads, and slippage.

Days+

SETTLEMENT LATENCY

Average timeframe spent awaiting manual corporate withdrawal clearance and bank processing.

0%

IMMUTABLE GUARANTEES

Zero mathematical enforceability when code execution remains subject to administrative discretion.

Counterparty risk cannot be mitigated through corporate trust; it must be eliminated through deterministic code.

Centralized Custody & Moral Hazard

Why custodial pooling creates inevitable insolvency and counterparty breakdown.

In conventional network models, participant capital is routed into an **operator-controlled corporate treasury** or centralized multi-signature account before any commissions are paid.

This centralized custody creates an insurmountable agency dilemma. Platform operators face speculative temptation, commercial mismanagement, or market volatility that introduces irreversible balance sheet deficits.

Even under ethical management, external pressures such as banking de-platforming, asset freezes, and hosted infrastructure breaches regularly result in catastrophic loss of participant funds.

The Custodial Breakdown Sequence

- ✗ User deposits capital → Funds enter operator-controlled custodial treasury.
- ✗ Off-chain liquidity management introduces deficits and reserve shortfalls.
- ✗ Withdrawal requests accelerate → Admins introduce artificial tiers, fees, and caps.
- ✗ Insolvency hardens → Management freezes smart contracts or deletes infrastructure.
- ✗ Total capital loss and permanent destruction of community organization.

Downstream Repercussions on Leaders & Participants

Evaluating the asymmetric damages sustained by community architects and everyday users.

Impact on Organization Architects

- ✗ Severe reputational damage when centralized platforms freeze user withdrawals.
- ✗ Irrevocable loss of network capital and years of community development.
- ✗ Unilateral account termination for raising transparency or governance inquiries.
- ✗ Arbitrary commission caps truncating earned revenue to shore up corporate debt.
- ✗ Exhaustion and community fragmentation across global distribution channels.

Impact on Everyday Participants

- ✗ Capital deposits trapped behind multi-week manual withdrawal queues.
- ✗ 10% to 30% eroded by administrative spreads and transfer surcharges.
- ✗ Transaction failures caused by complex 42-character hexadecimal addresses.
- ✗ Capital impairment driven by speculative daily-return schemes lacking production.
- ✗ Erosion of confidence in decentralized technologies and peer-to-peer finance.

Incomplete Attempts: Why Prior Models Failed

Evaluating the technical limitations of proxy contracts, inflationary tokens, and legacy layer-1s.

Many past platforms marketed themselves as 'decentralized' while retaining hidden `onlyOwner` functions, upgradeable proxy contracts, or centralized off-chain SQL databases.

Other platforms attempted to service obligations through hyper-inflationary native tokens with unbacked liquidity, causing member balances to suffer rapid purchasing power erosion within months.

Equora resolves these systemic flaws by deploying immutable Solidity contracts on Trobium, enforcing zero administrative spread, and denominating transactions in liquid TROB Coin.

Three Recurring Historical Flaws

- ✗ **Upgradeable Proxies:** Central administrative keys allowed underlying code logic to be rewritten without consent.
- ✗ **Token Inflation:** Compensating users in unbacked native governance tokens that trended to zero.
- ✗ **Prohibitive Gas Costs:** Deploying on legacy networks where transaction fees reached \$15 to \$50 per execution.

02

Protocol Invariants & Mathematical Guarantees

The six architectural principles hardcoded into Equora smart contract bytecode.

Six Core Invariants of the Equora Protocol

Architectural parameters enforced by immutable smart contract execution on Trobium.

01

ZERO ADMIN

No administrative override keys, upgrade proxies, or backdoors. Smart contract ownership is non-existent.

02

0% FEES

Zero corporate spread extracted. 100% of capital inflow is partitioned and pushed directly to users and pools.

03

UNRESTRICTED

No artificial earning caps, forced tier expirations, or daily withdrawal thresholds on matrix slots.

04

PRODUCTION MODEL

No speculative 'daily ROI' claims. Pure peer-to-peer distribution based on verifiable matrix completions.

05

FULLY DEPLOYED

Bytecode compiled, tested, and actively executing on Trobium blockchain with public explorer transparency.

06

PUSH SETTLEMENT

All payouts push directly to recipient non-custodial Web3 wallets at block speed with zero claim delays.

Legacy Custodial Schemes vs. Equora Sovereign Protocol

Direct structural evaluation across governance, fee structures, and execution security.

Legacy Custodial Schemes

- ✗ Operators retain private keys and pool user funds in corporate accounts.
- ✗ 10% to 30% platform commissions captured by administrators.
- ✗ Manual withdrawal queues subject to arbitrary approval latency.
- ✗ Artificial commission ceilings and forced rank demotions.
- ✗ Hosted SQL database architecture exposed to single-point shutdown.
- ✗ Complex 42-character hexadecimal addresses causing high drop-off.

Equora Sovereign Protocol

- ✓ Zero admin custody — 100% self-sovereignty via Trobsafe Web3 wallet.
- ✓ 0.00% Platform spread — 100% of all capital distributes to users and pools.
- ✓ Instant block-speed push settlement with zero withdrawal requests.
- ✓ Unrestricted matrix capacity governed by mathematical logic.
- ✓ Immutable Solidity smart contracts deployed permanently on Trobium.
- ✓ Frictionless 5-digit numeric referral IDs registered on-chain.

The Six Pillars of Sovereign Protocol Design

Foundational engineering components ensuring permanence, scalability, and liquidity velocity.

01

Non-Custodial

Liquidity never pools in an admin wallet. Payouts route directly into participant Trobsafe wallets.

02

Zero Intermediaries

Governed exclusively by immutable Solidity logic on Trobium. No human entity can halt operations.

03

Numeric Registry

5-digit referral mapping eliminates transcription errors and simplifies verbal user onboarding.

04

600% Matrix Cash

Each Slot 1 matrix board distributes \$180 pure cash directly across 6 designated node fills.

05

4 Protocol Pools

Nodes 4, 5, and 14 continuously feed Genesis DAO, Salary Pool, Blind Box, and Level Rewards.

06

2-Referral Gate

A strict 2-referral qualification benchmark ensures sustained network participation across all boards.

“

**Zero Administrative Custody. Zero Platform Spread. Zero
Discretionary Interference.
Pure Deterministic Execution on the Blockchain.**

EQUORA PROTOCOL • ARCHITECTURAL SPECIFICATION

03

Infrastructure & On-Chain Mechanics

Native deployment on Trobium Blockchain, real-time TROB pricing, Trobsafe wallet, and 5-digit registry.

Trobium Blockchain & Real-Time TROB Settlement

High-throughput, sub-second execution layer optimized for high-frequency micro-distributions.

Equora.Fi is built natively upon the high-throughput **Trobium Blockchain**. Unlike legacy networks burdened by volatile gas spikes, Trobium delivers deterministic sub-second finality and sub-cent execution fees.

All slot activations, protocol pool allocations, and milestone bonuses execute in liquid **TROB Coin** — the native asset of the Trobium ecosystem. Transactions dynamically track on-chain pricing oracles to enforce precise dollar valuations.

Participants maintain full cryptographic self-sovereignty via the non-custodial **Trobsafe Wallet**. Private keys remain exclusively in user possession at all times.

10,000+ TPS • Sub-Second Finality • \$0.0001 Average Gas

Infrastructure Metrics

- **Trobium Blockchain:** EVM-compatible execution layer engineered for high-frequency decentralized settlements.
- **Live TROB Oracle:** Real-time on-chain pricing feeds; all earnings distributed dynamically in liquid TROB Coin.
- **Trobsafe Non-Custodial Wallet:** Biometric security, hardware integration, and direct contract call execution.
- **5-Digit Registry IDs:** Unique numeric identifiers registered on-chain for frictionless lineage mapping.

On-Chain 5-Digit Referral Registry

Eliminating hexadecimal friction through immutable numeric mapping on EquoraRegistry.sol.

⚠️ 40%+ ONBOARDING DROPOFF

The Hexadecimal Address Problem

0x71C829aB45Fe61D87c42bE980482B7f3...9a
42-character hexadecimal string – prone to transcription and clipboard error

- ✗ New participants abandon registration when faced with complex 42-character strings.
- ✗ QR codes regularly fail or distort in compressed messaging applications and SMS.
- ✗ Zero verbal communication capability — impossible to share accurately in speech.

⚡ LOW-FRICTION ONBOARDING

The 5-Digit On-Chain Solution

REFERRAL ID: # 1 0 4 8 2

✓ Bound cryptographically to user wallet on Trobium blockchain

- ✓ Verbal sharing in seconds: "Join using sponsor ID 10482".
- ✓ EquoraRegistry.sol maps 5-digit integers directly to user wallet addresses.
- ✓ Eliminates transcription drop-off and accelerates team onboarding velocity.

04

The 10-Step Participant Lifecycle

The deterministic journey from wallet pairing to multi-pool compounding settlement.

The 10-Step Protocol Lifecycle (Stages 1 – 5)

Initial onboarding, cryptographic sponsor binding, and matrix qualification.

The 10-Step Protocol Lifecycle (Stages 6 – 10)

Autonomous dividend accrual, monthly salary settlement, and block-speed delivery.

Phase 1: Registration, Activation & Qualification (Stages 1 – 5)

Detailed operational mechanics of initial placement and matrix progression.

PHASE 1 • ACTIVATION

From Wallet Pairing to Full Qualification

Zero custodial account creation. Connect Trobsafe wallet, enter your sponsor's 5-digit code, and activate Slot 1 (\$30) in seconds.

Stages 1 & 2 — Wallet & Sponsor Lineage: Connect your non-custodial wallet and input your inviter's 5-digit referral ID. EquoraRegistry.sol writes the cryptographic parent-child lineage irrevocably onto Trobium.

Stage 3 — Slot 1 Activation (\$30): Deposit \$30.00 USD in live TROB Coin to open your 14-node board. 100% of capital routes immediately peer-to-peer into the active matrix topology.

Stages 4 & 5 — 2-Referral Benchmark & Auto-Scaling: Sponsoring 2 active participants satisfies the protocol qualification gate, enabling autonomous slot upgrades via Nodes 4 & 5.

⚡ ARCHITECTURAL LOGIC

Requiring exactly 2 active referrals maintains continuous network velocity while eliminating the predatory recruitment structures of traditional multi-tier programs.

Phase 2: Protocol Pools & Autonomous Settlement (Stages 6 – 10)

Operational mechanics of automated protocol pools and block-speed push disbursements.

PHASE 2 • DIVIDENDS

Automated Protocol Yield Engines

Qualified participants access four autonomous yield engines executing perpetually on-chain without human administration.

Stage 6 — Ecosystem & DAO Pool: Founding leaders acquire one of 100 Genesis Council seats (\$300). Entry deposits distribute immediately to prior seat holders via $\$300 / (N-1)$ up to a 3X (\$900) cap.

Stage 7 — 10% Magic Blind Box: Account initializes an individualized 91-day on-chain countdown lock, accruing 10% of protocol pool volume for long-term network alignment.

Stages 8, 9 & 10 — Salary Pool, Level Rewards & Instant Payouts: Automated monthly salary distributions settle on the 11th (40%), 15% Level Rewards disburse instant milestone cash, and funds arrive instantly in Trobsafe.

 ZERO ADMINISTRATIVE DELAY

Smart contracts execute all distributions synchronously upon block confirmation. There are no manual withdrawal approvals, processing queues, or corporate intermediaries.

05

The 4 Automated Protocol Pools

Deterministic allocation of 100% of protocol pool volume across Ecosystem & DAO, Salary Pool, Blind Box, and Level Rewards.

100% Automated Protocol Pool Distribution

Protocol pool capital is funded by Nodes 4, 5, and 14 and partitioned deterministically via EquoraVault.sol.

35%

Ecosystem & DAO Pool

Hard-capped at 100 seats. \$300 entry with 3X (\$900) cap and automated vacancy re-allocation.

40%

Community Salary Pool

Monthly distribution settled on the 11th across Alpha, Prime, Elite, and Crown with rank stacking.

10%

Magic Blind Box Pool

91-day on-chain countdown lock reserve distributing accrued yield in live TROB Coin upon maturity.

15%

Level Milestone Rewards

Instant milestone cash bonuses (10%, 15%, 25%, 50%) plus Soulbound NFT achievement credentials.

35% DAO + 40% Salary + 10% Blind Box + 15% Level Rewards = Exactly 100.00% Distributed with 0.00% Administrative Retention.

Pool 1: 35% Ecosystem & DAO Council Pool

Sovereign governance body and primary dividend beneficiary hardcoded to 100 on-chain seats.

The Ecosystem & DAO Pool represents the supreme governance tier and premier dividend beneficiary of Equora.Fi, created for founding ecosystem architects and institutional partners.

The Council is strictly limited to **100 on-chain seats** (`maxSeats = 100`). Once 100 positions are registered, the smart contract prevents further issuance. Council members hold equal voting rights (1.0% each).

Active seat holders receive equal pro-rata disbursements of **35% of all protocol pool volume** generated by completed matrix boards globally.

Council Parameters

- **Fixed 100-Seat Supply:** Immutable smart contract ceiling. No 101st seat can ever be minted.
- **Genesis Window (Days 1–21):** Open buy-in at \$300 (0 referrals); 100% distributed via $\$300 / (N - 1)$.
- **35% Lifetime Share:** 35% of all protocol pool inflows split equally among active council positions.
- **3X (\$900) Cap & 48h Re-Topup:** Enforces continuous liquidity circulation and prevents stagnant extraction.

Pool 2: 40% Community Salary Pool

Autonomous monthly leadership distributions settled on the 11th based on verifiable network milestones.

Tier 1: Alpha

42 Completed Slots

- Entry leadership tier
- 25% share of the 40% pool
- 10% instant milestone bonus

TIER 1 ACTIVE

Tier 2: Prime

84 Completed Slots

- Established organization builder
- Dual Stacking: Alpha + Prime
- 15% instant milestone bonus

DUAL STACKING

Tier 3: Elite

126 Completed Slots

- Senior organization architect
- Triple Stacking: Alpha + Prime + Elite
- 25% instant milestone bonus

TRIPLE STACKING

Tier 4: Crown

168 Completed Slots

- Apex platform leadership tier
- Quadruple Stacking: All 4 Tiers
- 50% instant milestone bonus

QUADRUPLE STACKING

Settled on the 11th of every month at 00:00 UTC via immutable smart contract execution.

Pool 3: 10% Magic Blind Box Reserve

Autonomous, time-locked accumulation reserve designed to incentivize long-term network retention.

The 10% Magic Blind Box is an on-chain, time-locked reserve engineered to foster long-term community alignment and eliminate short-term turnover.

Upon activating Slot 1, an individual **91-Day (3-Month) on-chain countdown timer** is initialized for the participant's address. A live dashboard widget tracks remaining duration until maturation.

Throughout the lock period, 10% of all protocol pool inflow continuously accumulates into the vault, releasing programmatically in live TROB Coin upon lock expiry.

Technical Specifications

- **91-Day Time-Lock:** Smart contract countdown timer initiated synchronously upon initial slot activation.
- **Continuous Capital Accrual:** 10% of protocol pool inflow (Nodes 4, 5, 14) streams continuously into the vault.
- **Retention Alignment:** Encourages participants to maintain active network coordination and team support.
- **Automated Maturity Release:** Matured allocations disburse directly to eligible participant wallets on block confirmation.

Pool 4: 15% Level Milestone Rewards

Instant milestone cash bonuses and Soulbound proof badges disbursed upon rank achievement.

To incentivize continuous network expansion and reward active leadership, 15% of all protocol pool volume is allocated to instant milestone Level Rewards.

Rather than awaiting monthly distribution cycles, the contract disburses instant cash bonuses directly into wallets in the exact block that a milestone is reached: **Alpha (10%), Prime (15%), Elite (25%), and Crown (50%)**.

Each rank achievement is certified on-chain via a permanent, non-transferable Soulbound credential, providing transparent cryptographic proof of leadership standing.

Reward Mechanics

- **15% Protocol Inflow:** Funded deterministically by matrix node allocations (Nodes 4, 5, 14).
- **Instant Milestone Cash:** Alpha = 10%, Prime = 15%, Elite = 25%, Crown = 50% milestone bonuses.
- **Soulbound Proof Badges:** Non-transferable on-chain credentials certifying verified organization rank.
- **Non-Custodial Delivery:** Disbursed immediately in liquid TROB Coin directly to connected wallets.

06

Matrix Engine & Liquidity Topology

14-node deterministic binary routing, autonomous auto-upgrades, and the perpetual self-funding flywheel.

14-Node Matrix Architecture & Payout Routing

Deterministic capital dispersion across matrix owner, uplines, downlines, and protocol vaults.

Equora.Fi operates a high-velocity 14-node binary matrix architecture. Upon board activation, 100% of deposited capital is routed peer-to-peer at block speed with zero administrative retention.

Exact Payout Routing (\$420 Gross Volume per \$30 Cycle):

- **6 Direct Cash Nodes** (P3, P6, P8, P9, P11, P12) pay \$180 pure cash (600% ROI) to the matrix owner.
- **2 Upline Pass-Up Nodes** (P1, P2) pay \$60 to direct upline sponsors.
- **3 Team Spillover Nodes** (P7, P10, P13) route \$90 directly to downline team members.
- **Nodes P4, P5, and P14 (\$90 total)** route to the 4 Automated Protocol Pools via EquoraVault.sol.
- On Cycle 1: Nodes 4 and 5 (\$60 total) simultaneously auto-activate Slot 2 for free!
- Node P14 re-seeds and recycles the board for the next cycle.

Qualification Gate: Sponsoring 2 active direct referrals satisfies the protocol requirement for matrix level progression and pool participation.

Matrix Invariants

- **100% P2P Push Transfer:** Funds route wallet-to-wallet in the same transaction block; zero escrow.
- **2-Referral Benchmark:** Mandatory prerequisite to unlock multi-slot scaling and protocol pools.
- **Bidirectional Spillover:** Upline and downline placement dynamics accelerate board completions.
- **Indefinite Auto-Recycle:** Matrix boards reset upon Node 14 completion, producing perpetual repeat cycles.

The Perpetual Protocol Value Flywheel

Closed-loop capital circulation connecting matrix completions, protocol vaults, and community yield.

The 5-Stage Sustainable Cycle

- ✓ **1. Matrix Activations:** Every board completed delivers \$180 pure cash directly to the matrix owner.
- ✓ **2. Continuous Pool Fueling:** Nodes 4, 5, and 14 deposit \$90 into the 4 Automated Protocol Pools.
- ✓ **3. Deterministic Yield Settlement:** Liquidity streams to DAO Council, Salary Pool, Blind Box & Level Rewards.
- ✓ **4. Network Expansion:** Frictionless 5-digit referral registry drives rapid on-chain registration.
- ✓ **5. Autonomous Slot Scaling:** Higher tiers (\$60 to \$61,440) multiply pool volume with zero personal capital.

Stakeholder Alignment

- ✓ **Active Organization Leaders:** 600% matrix cash + permanent monthly recurring salary pool shares.
- ✓ **Genesis DAO Council:** Equal pro-rata share of 35% global matrix volume across the protocol.
- ✓ **Community Participants:** Downline team assistance, 91-day loyalty reserve, and milestone bonuses.
- ✓ **Protocol Security:** Exactly 0 liabilities, 0 administrative debt, and 0 custodial dependencies forever.

Protocol Synthesis: Structural Vulnerabilities Solved

Consolidated comparison of legacy network defects against Equora's deterministic execution.

Centralized Defects Eliminated

- ✗ Eliminates admin corruption, private key abuse, and rug-pull vulnerabilities.
- ✗ Abolishes platform fees — 100% of capital inflow is returned to users and pools.
- ✗ Eliminates withdrawal queues and manual corporate approval latency.
- ✗ Replaces speculative daily yields with transparent, production-based peer-to-peer distribution.
- ✗ Resolves hexadecimal crypto wallet confusion via on-chain 5-digit numeric IDs.

Autonomous Protocol Engines

- ✓ 100% Immutable Solidity smart contracts deployed on Trobium Blockchain.
- ✓ 35% Ecosystem & DAO Pool (100 seats strictly limited for 21-day Genesis Window).
- ✓ 40% Community Salary Pool settled on the 11th across Alpha to Crown tiers.
- ✓ 10% Magic Blind Box with 91-day smart contract countdown loyalty lock.
- ✓ 15% Level Milestone Rewards with instant cash bonuses and Soulbound badges.

“

Zero Administrative Custody. Zero Platform Spread. Zero Limits.

Autonomous Peer-to-Peer Protocol Execution.

EQUORA.FI • BY LEXVRA • DEPLOYED ON TROBIUM BLOCKCHAIN • SECURED BY TROBSAFE
